Chapter 3

Influence of Star Bioscientists on Obtaining Venture Capital for Canadian Dedicated Biotechnology Firms

Johanne Queenton University of Sherbrooke, Canada

> Sophie Veilleux Laval University, Canada

ABSTRACT

As organizations based on science, dedicated biotechnology firms (DBFs) establish very narrow links with universities and public research institutions in developing their technologies. This chapter examines the influence of DBF relationships with star bioscientists on their venture-capital funding. It proposes a new definition of bioscientists anchored in today's technological practices. It also classifies Canadian bioscientists into four categories to give a national overview of their involvement with DBFs. The cross-analysis of 150 Canadian DBFs active in human-health applications and 431 bioscientists confirms the positive impact of these relationships on obtaining venture capital when a star is involved because of the credibility it brings to the firm. Moreover, results show that bioscientists most often chose to establish contractual agreements with existing firms or start their own. Future research directions and implications for policy makers are discussed.

INTRODUCTION

As organizations based on science, dedicated biotechnology firms (DBFs) establish very narrow links with universities and public research institutions. This development of new relationships constitutes the base of an innovation structure that connects basic research, applied research, and development as never before (Etzkowitz, 2010). Recognizing the role of universities and public research institutions in the development of new technologies opens the door to a systemic conception in which a vast set of institutions can co-evolve with the technology. The literature contains little about this new dynamic and even less so about the impact academic researchers have on the growth of private businesses.

More than ever, knowledge is the force driving economic growth, leading to ever-closer ties between science and technology (Buigues, 2000; Freeman, 1982; Gibbons et al., 1994). In particular, much of the technological change in biotechnology depends on the efforts put into exploiting new scientific and technological discoveries. Moreover, these inventions turn into commercial applications more rapidly than in the past, which is why biotechnology businesses are forming ties with universities and government research institutes. This constitutes the basis for a new innovation structure bringing basic and applied research closer to development (Etzkowitz, 2008, 1994). As a result, technology companies based on scientific discoveries sometimes succeed in growing according to specific criteria. Indeed, just a few factors seem to account for biotechnology-firm performance during the 1990s, specifically patent ownership, venture capital, expansion into export markets, and strategic alliances with multinationals (Niosi, 2003; Niosi & Bas, 2001). Zucker et al. (1998) identified another performance determinant, namely star-scientist ties with American biotechnology firms. These star scientists, who have made major biotechnology discoveries, prefer to enter into contracts with existing firms or launch their own biotechnology companies in the same region instead of turning over their research to their university or a government research institute.

Zucker and Darby (1995) define a star scientist as one who has discovered and published more than 40 gene sequences over a five-year reference period (1990–1994), such as compiled in GenBank. Because of the development of technology since then and research also showing the importance of patents (Hagedoorn & Cloodt, 2003; Niosi, 2003), a new definition of star bioscientist must be proposed.

This chapter looks specifically at the influence of intellectual capital that academic researchers bring to DBFs and which impacts positively on the obtaining of venture capital. Becoming allied to researchers that have made important discoveries somehow increases a firm's value. In this field in which scientific 20 more pages are available in the full version of this document, which may be purchased using the "Add to Cart" button on the publisher's webpage: <u>www.igi-</u> <u>global.com/chapter/influence-of-star-bioscientists-on-</u> <u>obtaining-venture-capital-for-canadian-dedicated-</u> <u>biotechnology-firms/169514</u>
