Chapter 29
The Understanding of Spatial–Temporal Behaviors

Yu-Jin Zhang
Tsinghua University, China

ABSTRACT

This chapter introduces a cutting-edge research field of computer vision and image understanding – the spatial-temporal behavior understanding. The main concepts, the focus of research, the typical technology, the fast development, etc. of this new field in recent years are overviewed. An important task in computer vision and image understanding is to analyze the scene through image operation on the image of scene in order to guide the action. To do this, one needs to locate the objects in the scene, and to determine how they change its position, attitude, speed, and relationships in the space over time. In short, it is to grasp the action in time and space, to determine the purpose of the operation, and thus to understand the semantics of the information they passed. This is referred ti as the understanding of spatial-temporal behaviors.

INTRODUCTION

The human visual process can be seen as a complex process ranging from feeling (feel the projection of 3-D world on the resulting 2-D image) to perception (capturing the content and meaning of 3-D world with 2-D images) (Kong, 2002). The ultimate goal of vision, from the narrow sense, is to make a meaningful interpretation of the world and the description of the scene; while broadly speaking, it includes also designing a behavior plan based on these explanations and descriptions, and in accordance with the surroundings and wishes of viewers. Computer vision is to realize the task to make computer refers to the human visual function, hoping to make a meaningful judgment on realistic goals and scenarios based on perceived images (Shapiro, 2001). This is just also the goal of understanding.

An important task in computer vision and image understanding is to analyze the scene through image operation on the image of scene in order to guide the action. To do this, one needs to locate the objects in the scene, and to determine how they change its position, attitude, speed and relationships in the space over time. In short, it is to grasp the action in time and space, to determine the purpose of the

operation, and thus to understand the semantics of the information they passed. This is refereed as the understanding of spatial-temporal behaviors.

Behavior-based automatic target image/video understanding is a very challenging research issue. It includes the access of objective information (image/video acquisition sequence), the process of relevant visual information, the analysis of contents (expression and description), as well as the interpretation on the basis of the image/video information, in order to achieve learning and recognition of behavior.

BACKGROUND

Research forces and results around such a topic are just appeared in recent years, some statistics can be seen from the survey on image engineering (Zhang, 2015c). The annual survey series of the yearly bibliographies on image engineering has started in 1995 and has been carried out for 21 years (Zhang, 2016). When the series enters its second decade (for the literature statistics of 2005), with the appearance of some new hot spots in the image engineering research and application, a new subcategories (C5): spatial-temporal technology (including 3-D motion analysis, gesture and posture detection, object tracking, behavior judgment and understanding) has been added into the image understanding category (C) (Zhang, 2006). The emphasis here is the comprehensive utilization of a variety of information possessed by the image/video in order to make the according interpretation for the dynamics of scene and objects inside.

In the past eleven years, the number of publications belong to the subcategory C5 in the annual survey series has attend a total of 153. There are five subcategories in category C, and the total number of publications belong to category C in these eleven years is 1352, so the subcategory C5 is still a small subcategory. Their distributions in each years are shown in the bars in Figure 1, in which a 3-order polynomial curve fitting to the number of publications of each year is drawn to show the change trends. Overall, this is still a relatively new field of research, so its development is not too stable, yet.
