### **ABSTRACT**

*This study delves into personal narratives of mental health crises and psychiatric treatment, comparing them with an extended Caplan's Crisis Theory. The objective is to unravel identifiable phases and turning points in these narratives, challenging traditional diagnostic categories and advocating for a paradigm shift in crisis intervention strategies. Through meticulous analysis, distinct phases of mental health crises emerged, showcasing the impact of interventions on recovery trajectories. Proposed alternative crisis categories highlighted the universal quest for safety and professional care, countered by social barriers. The study calls for a paradigm shift in mental health services, emphasizing psychosocial factors and community support. Through empathetic understanding and strategic interventions, mental health services can be restructured to be more responsive, fostering recovery and resilience among individuals facing mental health crises.*

## **INTRODUCTION**

This research delves into the personal narratives of individuals experiencing mental health crises and undergoing psychiatric treatment, comparing these accounts with an extended application of Caplan's Crisis Theory. The primary objective is to identify distinct phases and turning points within these narratives, challenging conventional diagnostic categories and advocating for a paradigm shift in crisis intervention strategies. Through meticulous analysis, the study reveals discernible phases in mental health crises, illustrating the influence of interventions on recovery trajectories. Proposed alternative crisis categories underscore the universal pursuit of safety and professional care, hindered by prevailing social barriers. Individuals may see mental health crises and breakdowns as tragic events, but they also provide chances for personal development and transformation (Lawrance et al., 2022). According to statistics, the number of cases of mental health crises has been rising globally in recent times (Holmes et al., 2020). This empirical data highlights a crucial problem that demands quick action, affecting an estimated 450 million people (World Health Organization, 2022). In addition, research by Jordanova, (2021) shows that people from different socioeconomic backgrounds have very different access to crisis care, which makes things even more difficult for them both during and after a crisis. The widespread dissatisfaction with post-crisis care demonstrates a serious flaw in the current system (Williams et al., 2021). More efficient, fair, and all-encompassing mental health services are required, especially in the wake of catastrophes, and these patterns indicate a real and doable issue.

There are four parts to this chapter. The research and its methods are introduced in the first part. Section two presents the study's findings, which are structured around the following themes: the crisis's psychosocial origins, the crisis's stages, the point at which the individual begins to recover or becomes a long-term mental health patient, and the effect of the crisis on the individual's social status, employment prospects, and self-sufficiency. Section three talks about how these discoveries may be used to treat and prevent mental health crises. At the end of the chapter, in Section four, the key themes will be reviewed and suggest where the future study should go. This chapter argues that more effective and suitable preventative and treatment programs may be developed by listening to the stories of people who have been through mental health crises and breakdowns. Researchers concluded that crisis services should prioritize self-advocacy, active listening, and community support based on a psychosocial model of crisis.

This research explores the complex terrain of mental health crises through the insightful stories of people who have survived devastating breakdowns. After reviewing the literature extensively, the author based our investigation on Caplan's Crisis Theory and will show how it applies to crisis situations' psychological
