### **EXECUTIVE SUMMARY**

*Transformational e-government projects and large-scale Enterprise Information System (EIS) implementation projects have one thing in common: they both overrun their time and budget due to unclear vision and unrealistic expectations. The aim of this chapter is to report on a success story of implementing e-government in the Higher Education Admission Centre (HEAC) that is beneficial in providing an insight to both categories of projects. The case is unlike many other case studies that look at project failures; it is concerned with exploring and discussing the key critical factors that facilitate the success of the projects of both categories (Brady & Maylor, 2010). The research is a qualitative approach, and the investigation uses a single case study, with data collected by means of semi-structured interviews*

## ***E-Government and EIS Change Management and Critical Success Factors***

*and organisational documents from the Ministry of Higher Education in Oman. The research findings suggest that there are three paradigms with a set of factors that impact the success of projects, namely organisational paradigm, technology paradigm, and end-user paradigm.*

## **INTRODUCTION**

This chapter discusses the effect of change and the use of e-government in the Omani Higher Education Admission Centre (HEAC), and through a large and complex transformational process. In addition, the chapter will look at the Critical Success Factors (CSFs) that can be effectively adopted to manage such change and transformation.

During the last 15 years, the public sector worldwide has embarked on a wide range of reforms and has witnessed a steady growth in the adoption of new ICT solutions and the number of Web-enabled Enterprise Information Systems and e-government transformational projects (Rinderle-Ma & Reichert, 2009; Pham & Teich, 2011). Public Sector Organisations (PSOs) are increasingly seeking new tools to improve their performance and to provide better services to their citizens (Quartel, et al., 2012). For example, Sharifi and Manian (2010) contended that many governments around the world are greatly supporting the electronic delivery of public services to the citizens and the enterprises, enabling them to make most of their transactions within the government via electronic channels, i.e. e-government. In its basic definition, e-government is “the use of Information and Communications Technology (ICTs), and particularly the Internet, as a tool to achieve better government” (OECD, 2003). Rose and Grant (2010) explained that more and more PSOs are implementing e-government initiatives in order to transform the way citizens and governments interact with each other. With e-government, PSOs have opportunities to do their jobs better, cheaper, and proved 24/7 hours access to citizens (Al-Fakhri, et al., 2008). Furthermore, citizens have the potential to interact electronically with government agencies anytime and anywhere (Terpsiadou & Economides, 2009). However, there are continuing cases of failure to realize expected benefits of such initiatives, resulting in significant losses (Ke & Wei, 2004; Heeks, 2004). According to Heeks (2004) who conducted studies on e-government projects in developing countries up to 35% of such projects have resulted in total failures, 50% have partially failed, and only 15% are considered successful. The picture is as gloomy considering the implementation of Enterprise Information Systems (EIS) and Enterprise Resource Planning (ERP) system with Standish group (2012) reporting up to 70% failures. Nevertheless, there are few EIS, ERP and e-government projects that have been deemed successful (Strang & Macy, 2001; Brady & Maylor, 2010;
